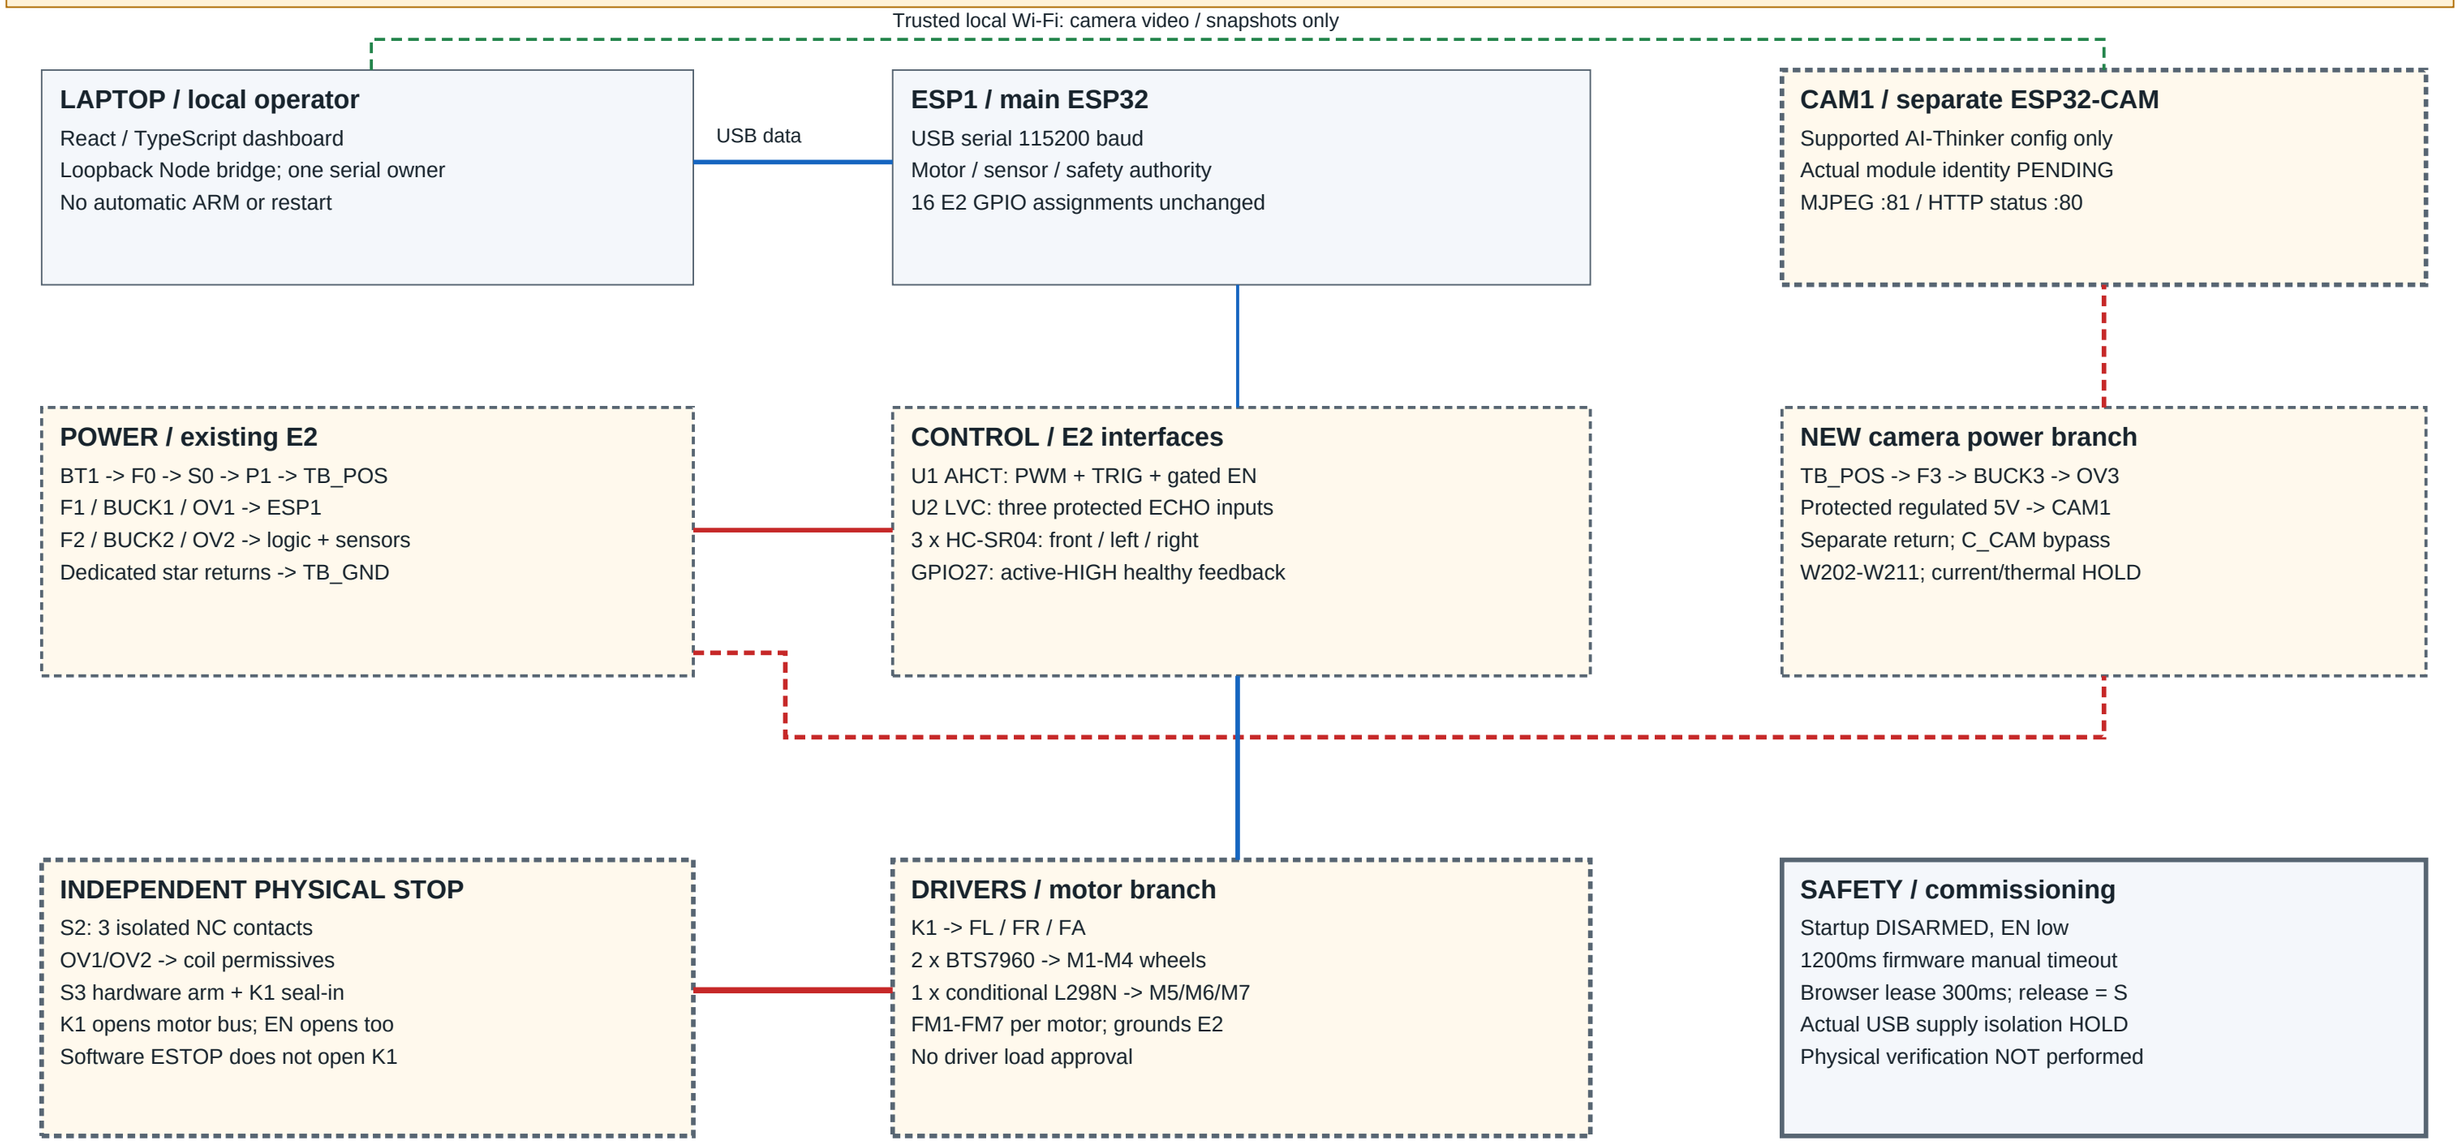
Rover full-system architecture / S1

Control and video are independent. E2 electrical package remains authoritative for W001-W201; camera additions W202-W211.

S1 DESIGN HOLD | Physical connections unapproved | Generic ports require actual-part mapping | 10 Nov 2026



Grounds: retain E2 star architecture and dedicated motor returns. Camera return routes via BUCK3 to TB_GND, never through ESP1 or laptop. Do not parallel any positive regulator output.
Camera power stays independent of K1 and cannot energize a motor output.

All blocks with dashed borders remain hardware HOLD. Generic ports are functions awaiting actual part selection, not manufacturer terminal numbers. Existing E2 sheets retain all resistor, fuse, motor and control-wire detail; the next sheet contains every new camera connection.

Red +supply | Black GND | Blue control | Green sensor | Orange motor | Thick = high-current | Dashed = missing/blocked
Net labels join across sheets. Crossings alone do not join. No component footprint / connector orientation is implied.
